ENIGMA BRCA1 and BRCA2 VCEP

The c.32T>G variant in BRCA1 is a missense variant predicted to cause substitution of Valine by Glycine at amino acid 11 (p.(Val11Gly)). This variant is absent from gnomAD v2.1 (exomes only, non-cancer subset, read depth ≥25) and gnomAD v3.1 (non-cancer subset, read depth ≥25) (PM2_Supporting met). Reported by 2 calibrated studies to exhibit protein function similar to pathogenic control variants (PMIDs: 30209399, 35659930) (PS3 met). This BRCA1 missense variant is within a key functional domain and the computational predictor BayesDel (noAF) gives a score of 0.325, above the recommended threshold of 0.28 for prediction of impact on BRCA1 function via protein

change. A SpliceAI score of 0.05 predicts no impact on splicing (score threshold ≤ 0.1) (PP3 met). Multifactorial likelihood ratio analysis using clinically calibrated data produced a combined LR for this variant of 1.15 (based on Family History LR=1.15), which is above the ENIGMA BRCA1/2 VCEP threshold for BP5 (>0.48) and below PP4 (<2.08) (BP5 and PP4 not met; PMID: 31853058). In summary, this variant meets the criteria to be classified as a Likely pathogenic variant for BRCA1-related cancer predisposition based on the ACMG/AMP criteria applied as specified by the ENIGMA BRCA1/2 VCEP (PM2_Supporting, PS3, PP3).
